Eyebrows

Before Eyebrow Procedure

6 Months Following Eyebrow Procedure
(120 total grafts transplanted)

Hair transplantation can do much more than rebuild hair lines and add density to the crown. Hair transplantation is also the only permanent and natural way to build or rebuild hair density to eyebrows and other facial areas.

Pictured above is a 45 year old male immediately before surgery and 6 months following. 120 total grafts were transplanted into both eyebrows – roughly 60 each side. Hairs began to grow at two-and-a-half months, and the patient says that he trims his eyebrows every two to three weeks to maintain the length and density he's looking for.
